SUMMARY

Full-stack software engineer with 3+ years building enterprise data-protection experiences — Angular WebUI over Java REST services for NetBackup and Cohesity DataProtect. Ships features end-to-end across UX, REST web services, Python automation, RBAC / discovery, and relational schema, spanning virtualization workloads (VMware, KVM, HPE VME/Morpheus, OLVM), recovery, and single-file restore. Pairs strong systems fundamentals with a data-driven approach from a dual CS + Statistics background; recently built LLM-powered internal tooling to automate engineering-contribution traceability across Jira, defect-tracking system, and Bitbucket.

SKILLS

Languages: Java, Python, C#, C, C++, JavaScript, TypeScript, SQL, HTML/CSS, YAML, OCaml, R
Front-End: Angular, RxJS, React, Next.js, Node.js, component-driven WebUI, responsive/mobile-first design
Back-End & Cloud: Spring Boot, REST/web services, RBAC & access control, AWS (S3, EC2, IAM), Kubernetes, Docker, Helm, CI/CD, Git
Databases & AI: SQL, MySQL, PostgreSQL, schema design & migrations, query optimization; LLM-powered tooling, prompt engineering, retrieval & summarization

EXPERIENCE

Cohesity Inc. (formerly Veritas Technologies LLC) Roseville, MN
Software Engineer II (MTS II) April 2025 – Present

- Led **onboarding of 2 new virtualization platforms** into Cohesity DataProtect — source registration, register-VM, source detail, and recovery flows in the WebUI using Angular over Java REST services, including **AWS S3** backup targets and containerized deployment on **Kubernetes** (Docker, Helm) — streamlining configuration workflows **~40%**.
- Drove continued enhancement of KVM workload support in NetBackup, improving reliability and coverage while hardening source registration and discovery to prevent invalid submissions.
- Built an **LLM-powered** internal tool that queries Jira, defect-tracking systems, and Bitbucket and summarizes engineering contributions, automating release traceability across 200+ incidents and pull requests everyday.

Software Engineer I (MTS I) Dec 2024 – March 2025

- Owned **end-to-end KVM workload support** for NetBackup, expanding coverage to a new hypervisor tier and delivering backup/recovery optimizations that reduced job completion time by **~45%**.
- Shipped **10+ NetBackup Web UI features** for full KVM management plus SQL schema changes and migrations backing them; maintained VMware continuity with **zero backup and recovery regressions** through the Cohesity-Veritas merger.

Veritas Technologies LLC Roseville, MN
Software Engineer (Associate) July 2023 – Dec 2024

- Rebuilt **VMware / vCloud recovery workflows** in NetBackup over Java REST services — recovery to NetBackup clients and folders, datastore/folder selection, and VMDK restore defaults — and drove CX-readiness UX consistency across the VMware workflow.
- Led multi-layer security and **RBAC** for VMware workloads; resolved **158 Coverity** static-analysis findings across Java and C++, hardening WebUI controllers and backend utilities.

Software Engineer (Part-time – Intern) May 2022 – May 2023

- Developed and maintained **10+ Java REST API endpoints** and build **Postman/Python automation scripts** to test them; shipped a NetBackup Web UI feature that **reduced single-file restore time by 80%**.

Department of Mechanical Engineering, University of Minnesota Minneapolis, MN
Full Stack Web Developer Jan 2022 – May 2023

- Developed website enhancements (responsive design, improved navigation, interactive features) increasing traffic and engagement; built a Particle Decay Modeling Simulation in C# to model classroom particle concentration.
-

EDUCATION

University of Minnesota-Twin Cities, Sept 2020 – May 2023
B.S. Computer Science & B.A. Statistical Practice GPA: 3.63/4.00, Dean's List
Coursework: Algorithms, Data Structures, and Program Development; Machine Architecture and Organization; Regression and Correlated Data; Theory of Statistics; Introduction to Statistical Analysis (TA)
